

Project Design Phase Solution Architecture

Date	14 July 2026
Team ID	SWTID-2026-2149
Project Name	Credit card approval prediction
Maximum Marks	4 Marks

Solution Architecture:

Solution architecture is a complex process – with many sub-processes – that bridges the gap between business problems and technology solutions. Its goals are to:

User Input: The user enters applicant details such as age, income, employment status, credit history, and other required information.

Data Validation: The system checks whether the entered data is complete and valid before processing.

Data Preprocessing: The input data is cleaned, transformed, and prepared for the Machine Learning model.

Machine Learning Prediction: The trained ML model analyzes the applicant's data and predicts whether the credit card application should be Approved or Rejected.

Result Display: The prediction result is displayed to the user in a simple and easy-to-understand format.

Data Storage and Model Update: The dataset and trained model are stored securely, and the model can be updated with new data to improve prediction accuracy in the future.
